

Fig A2.b - scaling of the primary regimes in unique molecules seen

pooled 5-fold scaffold CV ONLY · error bars on the ladders and the shaded band around each classical anchor are both ± 1 sd across the 5 folds (no head-seed, no pretraining-seed spread), so every interval means the same thing · the no_pretrain references are omitted here to keep the panels readable; see A1.a/A1.b · the 96M rung and unsup→sup's 48M rung are hold-out-only, so they are absent rather than interpolated · x = unique molecules, so a ladder that runs VERTICAL is spending compute on repetition, not on new chemistry; the sparse SFT pool caps at ~0.52M and the unsupervised corpus at 12M
