

Fig A1 (H1) - headline at 8M FP - balanced scaffold 5-fold CV (SI: easier split, split-variance error bars)

error bars = +/-1 std across 5 scaffold folds (real split variance) . NOTE: this split is easier than the DeepChem hold-out and compresses regime differences - use for uncertainty, not for headline effect sizes . replication - classical anchors x3 xgb seeds; 1 seed only: unsup_only, unsup2sup, sup_only:dense, sup_only:sparse_all, sup_only:dense_plus_sparse, sup_only:minimol_full, sup_only:mixed (replicates in flight, ~4h)
